EMS INFECTIOUS DISEASE PLAYBOOK
This document was created using official or best practice information taken from multiple organizations that was vetted and assembled by subject matter experts working for the Technical Resources, Assistance Center, and Information Exchange (TRACIE) at the request of the U.S. Department of Health and Human Services (HHS)/Office of the Assistant Secretary for Preparedness and Response (ASPR). The aim was not to develop novel guidance for emergency medical services (EMS) agencies, but to unify multiple sources of information in a single planning document addressing the full spectrum of infectious agents to create a concise reference resource for EMS agencies developing their service policies. This document does not represent official policy of HHS/ASPR or other federal or private agencies.

The information contained in this playbook is intended as a planning resource, and should be incorporated into agency standard operating procedures and reviewed by the EMS medical director. There is not one correct way to don and doff personal protective equipment; EMS agencies should review the guidelines and their specific circumstances to develop procedures that are ensemble and site appropriate. Appropriate education and training is critical to the success of infection prevention and control protocols. The authors, TRACIE, and HHS/ASPR take no responsibility and bear no liability for any clinical care outcomes, provider injury/illness, or inaccuracies in or resulting from this document. All recommendations were current at the time of publication and vetted to the best of our ability.

Inclusion of specific references and resources is offered as an acknowledgement of their contribution of material and for additional information for EMS planners, but does not constitute endorsement or vouch for accuracy or applicability of the referenced documents.
Dispatch/Responder Actions

GENERAL PRINCIPLES – CALL TAKING/DISPATCH

• Safe response by EMS requires an integrated approach: Appropriate information from the caller and dispatcher; appropriate protocols for response, clinical care, application of administrative and environmental controls and use of personal protective equipment (PPE) by responding EMS personnel; and transport to a hospital that can provide effective evaluation and treatment of the suspected condition.

• Ideally, 911 call takers/emergency medical dispatchers will identify possible infectious disease patients through integrated routine screening questions and relay that information to emergency responders prior to their arrival on the scene.

• During the caller interrogation, if information about communicable diseases is offered, make sure the information is documented and relayed to responders in accordance with established policies on how to share patient-related information.

• Screening for suspected highly infectious pathogens often involves questioning patients about recent travel to endemic areas and presenting signs and symptoms. The timeframe for these conditions varies (e.g., 14 days for Middle East Respiratory Syndrome (MERS), 21 for Ebola Virus Disease (EVD)); 21 days is used in the general screen for consistency since this is inclusive of the diseases, but can be adjusted as required if screening for specific pathogens.

• Local screening questions may be needed during outbreaks and can be inserted into the dispatch algorithm and keyed to the appropriate precautions. EMS agencies should consult with local and state public health and EMS authorities to identify required modifications to processes and protocols to ensure consistency with CDC guidance.

• If persons under investigation for a highly infectious disease are known to public health, it may be beneficial for public safety to enter a temporary note on their address in the computer-aided dispatch system to alert 911 responders to the potential for illness/exposure. This is a local decision dependent on the systems and policies in the community and the note should be removed once the infectious period has passed.

• Fever may be a helpful contributing sign or symptom, but should not be used exclusively to determine the presence or absence of disease as it is not universally present in cases of serious communicable diseases.
GENERAL PRINCIPLES – RESPONSE

- Regardless of dispatch information, EMS personnel should be vigilant for travel history and signs and symptoms of communicable disease (e.g., fever, cough, gastrointestinal complaints) and use standard precautions and add appropriate transmission-based infection control precautions whenever history or exam findings warrant.

- Implement strict standard and transmission-based precautions based on the patient’s clinical information to avoid exposure to potentially infectious bodily fluids, droplets, and airborne particles.

- Avoid direct contact with a patient who may have a serious communicable disease until you are wearing appropriate PPE. Maintaining a distance of at least six feet may provide protection from transmission of many diseases.

- Understand and practice with PPE so that you can rapidly and safely don and carefully doff the equipment without cross-contamination.

- Patients or their caregivers may find responders wearing high levels of PPE such as hood, suits, and respirators alarming. Communicating with and calming anxious patients may be more challenging due to PPE as well. Responders should be mindful of this and be prepared to reassure patients and to address their distress and fear.

- Limit the number of EMS providers making contact with a potentially infectious patient to the minimum required to perform tasks safely.

- EMS must be able to implement effective infection control practices to afford emergency responder safety while avoiding excessive delays in care. Training and practice should allow EMS personnel to provide emergent medical care without waiting for specialized response.

---

1 The maximum distance for droplet transmission is unresolved. While the area of defined risk has historically been a distance of less than 3 feet from the patient, experimental smallpox studies and SARS investigations suggest droplets could be transmitted 6 feet or more. The recommendation to maintain a distance of 6 feet or more is used throughout this document to be conservative given the uncertainty. Page 17 of https://www.cdc.gov/hicpac/pdf/isolation/isolation2007.pdf provides additional details.
GENERAL PRINCIPLES – RESPONSE, CONTINUED

• Specialized transport should be reserved for stable suspect serious communicable disease patients (e.g., EVD, Marburg Disease, smallpox) or for inter-facility transport of those with suspected or known disease. Many communities will also have dedicated infectious disease medical transport services built into their regional transportation plan for planned patient movements.

• Hand hygiene (e.g., handwashing with non-antimicrobial soap and water, alcohol-based hand rub, or antiseptic handwash) is one of the best ways to remove germs, avoid getting sick, and prevent the spread of germs to others.

• Placing a surgical mask on a patient with likely infectious cough significantly limits droplet generation. Patients should cover their nose and mouth when coughing or sneezing; use tissues to contain respiratory secretions and, after use, dispose them in the nearest waste receptacle; and perform hand hygiene after having contact with respiratory secretions and contaminated objects or materials.

• Influenza and other diseases can transmit via the ocular surfaces as well as other mucous membranes. Use PPE to protect the mucous membranes of the eyes, nose, and mouth during procedures and patient care activities that are likely to generate splashes or sprays of blood, body fluids, secretions, and excretions. Select masks, goggles, face shields, and combinations of each according to the need anticipated by the task performed.

• Infection control practices can evolve with novel agents or during infectious disease outbreaks or epidemics. The EMS agency must be aware of changes that affect employees.

• EMS agencies should exercise their response to a highly infectious disease patient with hospitals and other healthcare coalition partners.
**DISPATCH SCREENING ALGORITHM**

*Dispatch screening is designed to suggest the highest potential level of precautions that may be required. On-scene evaluation is required to adjust precautions according to history and exam. Transmission based precautions are always accompanied by standard precautions.*

1. **911 Call for Illness/ Sick Person**
   - Local Infectious Disease Outbreak or Epidemic Screening Questions
     - Yes: Specific Exposure and/or Symptoms
       - Yes: Disease-Specific Precautions
     - No: Precautions to Consider:
       - Yes: Ebola/VHF Precautions
     - No: No Specific Syndrome Identified
2. **International Travel/ Illness Screening Questions**
   - No Specific Syndrome Identified
3. **Cough/Respiratory Infection**
   - Yes: TB/Chickenpox/ Measles Exposure/ Risk
     - Yes: Airborne Precautions
     - No: Droplet Precautions
   - No: Contact Precautions
4. **Vomiting/Diarrhea**
   - Yes: Standard Precautions
   - No: Contact Precautions
5. **Other Symptoms**
   - Yes: Standard Precautions
   - No: Contact Precautions
NOTES ON THE ALGORITHM:

• Basic travel and symptom screening suggests a level of precautions for responders. On-scene, additional evaluation is required to determine if higher or lower levels of protection are required.

• If a medically trained dispatcher is not available, these questions may still be used. If the dispatch agency declines to ask these questions, a process should be in place to refer the caller to an emergency medical dispatcher (EMD) if possible or the crew may be able to establish contact with the patient/caller via a callback number. EMS systems should tailor these functions and adopt processes appropriate for their structure and staffing.

• Responders should be aware of infectious disease outbreaks or epidemics in their community and, based on a doorway evaluation, be prepared to rapidly adopt appropriate infection control precautions in accordance with established public health guidelines.

ADDITIONAL DISPATCH CONSIDERATIONS

The following information may be used to update/modify dispatch reference cards:

• Call taker obtains location (and phone number) and patient status information (e.g., age, consciousness, breathing normally).
  » Implement emergency medical dispatch to include giving the caller instructions to help treat the patient until the responding EMS unit arrives per service protocols.
  » Consider modifying assignment to ambulance only for calls involving suspect EVD/VHF or Special Respiratory Precautions patients based on travel or exposure history (i.e., cancel first responder unless unconscious, difficulty breathing, or other clear immediate life threat).

• Subsequent “Chief Complaint” information regarding type/severity of medical emergency:
  » Chief complaint – If illness-related 911 call, additional screening questions include:
    – Priority symptoms – severe bloody vomiting or diarrhea (e.g., large amounts of GI blood loss), decreased level of consciousness, respiratory difficulty, chest pain
    – Pertinent medical history - any known illness or exposures to Methicillin-resistant Staphylococcus aureus (MRSA), tuberculosis (TB), Clostridium difficile (C. difficile), norovirus, etc.
    – Pertinent travel history - any travel within the previous 21 days
Dispatch/Responder Actions

• For the following specific chief complaints ask additional questions (below) and provide emergency medical dispatch instructions as indicated:
  
  » Breathing problems
  » Chest pain
  » Headache
  » Sick person
  » Unknown Problem (Person Down)

• Additional questions
  
  » Is there anyone else there who is also sick?
  
  » In the last day or two any:
    
    – Fever or chills?
    – Severe cough?
    – Vomiting or diarrhea?
    – Active bleeding?

For any positive questions, the emergency medical dispatcher will alert any first responders and EMS providers being dispatched of potential for a patient with a communicable disease and to implement infection control measures as indicated. This designation is preliminary and responders may be able to adjust precautions based on further information from the patient/family. If language barriers prevent questions, the dispatcher should advise the crew that they cannot rule out an infectious patient.

Implement emerging infectious disease surveillance tool\(^2\) whenever a novel or dangerous disease is endemic in specific areas.

---

Dispatch/Responder Actions

ON-SCENE ASSESSMENT ALGORITHM

Signs/Symptoms
- GI
- Fever, flu-like
- Cough/respiratory
- Skin
- Prior antibiotic-resistant infection

Type of Precautions
- Standard (S)
- Droplet (D)
- Special Respiratory (SR)
- Contact (C)
- Airborne (A)
- EVD-VHF (E)

EVD/VHF with travel/exposure history - E
Norovirus with exposure history - C
C. difficile with history/diagnosis - C
Otherwise - S

Novel influenza, MERS, or similar with travel or exposure history - SR
Influenza - D
Strep pharyngitis - D
Otherwise - S

Novel influenza, MERS, similar with travel or exposure history - SR
Pneumonia - D for many causes
TB with diagnosis or risk factors - A
Otherwise - S

Large open wounds, drainage - C
Measles - exposure or typical rash - A
Zoster with open lesions - A, C
Chickenpox - A, C
Meningococcal disease (purpuric rash to extremities, usually very ill - D

MRSA - C
Vancomycin-resistant enterococci - C

Type of Precautions
(Transmission-based precautions are always accompanied by standard precautions.)
**FIRST RESPONDERS AND AMBULANCE RESPONDERS**

- Responders should have access to relevant information via radio or computer aided dispatch (CAD) to assure alerting of potential risks.

- Ask dispatch/communications center for additional information if needed.

- Identify patients who may be infected with a serious communicable disease by verbal screening and symptoms and recognize the potential hazards.

- First responders recognizing a potentially infectious patient should notify dispatch/communications center to assure the en route ambulance responders are prepared to implement appropriate infection prevention and control measures.

- Apply PPE appropriate for the patient’s condition prior to making direct patient contact.

- Patients with respiratory illnesses: Interview conducted at least 6 feet away from the patient may provide some protection from infectious droplets.

- Ask any patient with respiratory symptoms to wear a surgical mask if they can tolerate it.

- Limit the number of EMS providers making patient contact to the minimum required to perform tasks safely. Consider the strategy of one provider putting on PPE and managing the patient while the other provider does not engage in patient care, but provides the “doorway evaluation” and communications/charting. The second provider should be prepared to quickly don the appropriate PPE should the first provider require assistance.

- Avoid unnecessary direct contact with the patient.

- Use caution when approaching the disoriented or delirious patient, as erratic behavior (e.g., flailing or staggering) can place EMS providers at additional risk of exposure.

- Keep nonessential equipment away from the patient, so as to minimize contamination on the scene and in the ambulance.

---

3 Adapted from Identify, Isolate, Inform: Emergency Medical Services (EMS) Systems and 9-1-1 Public Safety Answering Points (PSAPs) for Management of Patients Who Present with Possible Ebola Virus Disease (Ebola) in the United States. Note that this document is somewhat dated.
Dispatch/Responder Actions

- If patient has nausea or vomiting, treat symptoms per protocols, provide emesis bag, and contain any emesis.
- For profuse diarrhea, consider asking the patient to wear an absorbing undergarment and/or wrapping the patient in an impermeable sheet to reduce contamination of other surfaces.
- Choose a receiving facility appropriate to the potential disease and alert them about the patient and estimated time of arrival (ETA) as early as possible.
- Contact medical control with questions or for additional guidance on symptoms/signs or patient care.

For geographically-associated serious communicable diseases like EVD or MERS, the public health or EMS medical authority may request responders ask additional screening questions including:

1. Travel history and/or direct exposure to potential case within the number of days of the incubation period for the illness of interest (e.g., Ebola – 21 days, MERS – 14 days)
2. Specific signs and symptoms of illness

Contact the EMS or public health authority for guidance about family members or close patient contacts who may be at the scene.
Dispatch/Responder Actions

GENERAL PPE CONSIDERATIONS

The following is a list of PPE referred to throughout this document. This is a suggested list only. Quantities and exact PPE stocked are dependent on ambulance service protocols and transport volumes/patient population. Modifications may be necessary for specialized transport units or during specific epidemics.

• Disposable exam gloves – standard gloves for standard precautions
• Disposable exam gloves – with elongated cuffs for use with barrier gowns/suits
• Cleanable goggles OR face shield
• Surgical masks for patients and providers
• Disposable fluid-resistant gown OR disposable fluid-resistant coverall
• Disposable National Institute for Occupational Safety and Health (NIOSH)-approved, fit-tested N95 or equivalent/higher level respirator (e.g., reusable half-face elastomeric respirator N95 or higher rating mask or PAPR with full hood and HEPA filter)
• Disposable boot/shoe covers

EVD/VHF Precautions – additional equipment required

• Full face shield (plus consider head cover)
• Respiratory protection options:
  » NIOSH-approved, fit-tested N95 respirator worn with impermeable hood that covers head and shoulders and full face shield
  » PAPR with HEPA filtration and integrated impermeable drape-style hood
• Boots (disposable or reusable)
• Fluid-resistant coverall – if service uses gowns for other contact exposures
• OPTION: Disposable, impermeable apron in addition to fluid-resistant coverall for unstable patients
Standard Precautions

Example Diseases

Acquired immune deficiency syndrome (AIDS)/human immunodeficiency virus (HIV) • anthrax (cutaneous or pulmonary) • botulism • cellulitis • dengue • minor wound infections including abscess • nonspecific upper respiratory infections

Goal of Precautions

Apply a standard set of protections based on the patient’s symptoms and the clinical care rather than a specific suspected organism. The goal is to apply PPE as needed to prevent exposure to bodily fluids and PPE is based on how the disease is transmitted. Examples include routine use of hand hygiene, gloves, and adding eye protection and mask for patients with respiratory symptoms and during airway interventions, or gown for potential splash exposures.

Dispatch Actions

• Resource assignment – usual assignment of first responders and appropriate basic life support (BLS)/advanced (ALS) response
• Patient instructions – usual pre-arrival instructions (porch light, control animals, gather medications, etc.)
• Crew instructions: Advise responding crew of patient illness/symptoms.
Standard Precautions

ARRIVING EMS ACTIONS/CONSIDERATIONS

- Assess patient upon arrival from a distance of six feet if possible.
- Adjust infection prevention precautions as required.
- Perform hand hygiene before and after patient care activities.

PPE

- Gloves during patient contact for any potential exposure to infectious agent or bodily fluids
- Goggles/face shield and surgical mask for any airway procedures (intubation, suctioning) or patient with active cough from apparent infectious source and to protect mucous membranes from splash/liquid exposure
- Impermeable gown for any situation likely to generate splash/liquid exposures
- Consider using a checklist to assist with proper donning and doffing.
- PPE should be removed in an appropriate doffing area to prevent secondary contamination. Meticulous care should be taken to avoid self-contamination. PPE waste should be placed in a labeled leak-proof container.
- Potential exposures should be reported according to existing service protocols.
Standard Precautions

PATIENT CARE CONSIDERATIONS

- Provide a surgical mask for all patients with acute infectious respiratory symptoms who can tolerate it.
- Provide tissues to patients for secretion control and encourage patient hand hygiene and cough etiquette practices.

TRANSPORT CONSIDERATIONS

- Standard transportation to appropriate hospital facility
- If the patient compartment is equipped with an exhaust fan, ensure that it is turned on.

AMBULANCE DECONTAMINATION

- Any visibly soiled surface must first be decontaminated using an Environmental Protection Agency (EPA)-registered hospital disinfectant according to directions on the label.
- Disinfect all potentially contaminated/high touch surfaces including the stretcher with an EPA-registered hospital disinfectant according to directions on the label.
- Medical equipment (stethoscope, blood pressure (BP) cuff, etc.) making patient contact should be disposable or cleaned and disinfected before use on another patient.

---

4 Selected EPA-Registered Disinfectants is relevant to all mentions of EPA-registered hospital disinfectants in this document.
Standard Precautions

RESOURCES

+ Guideline for Isolation Precautions 2007
+ Selected EPA-Registered Disinfectants
+ Standard Precautions in Health Care
+ Considerations for Selecting Protective Clothing used in Healthcare for Protection against Microorganisms in Blood and Body Fluids
Contact Precautions

**EXAMPLE DISEASES**

- Excessive wound drainage
- MRSA
- Vancomycin-resistant enterococci (VRE)
- *C. difficile*
- norovirus*
- other suspected infectious diarrhea
- head lice/body lice/scabies
- respiratory syncytial virus (RSV) (plus mask)

**GOAL OF PRECAUTIONS**

- Provide impermeable barriers to infectious agents that are either highly pathogenic, drug resistant, contagious, or persistent that can easily be contracted or spread to other environments via fomites and surface contact.

**DISPATCH ACTIONS**

- Resource assignment – usual assignment of first responders and appropriate BLS/ALS response
- Patient instructions – usual pre-arrival instructions (porch light, control animals, gather medications, etc.)
- Crew instructions – Advise responding crew of patient illness/symptoms.

*Wear mask during vomiting/diarrhea if norovirus suspected*
Contact Precautions

ARRIVING EMS ACTIONS/CONSIDERATIONS

- Be aware of any community-based outbreaks of norovirus or other epidemic disease requiring contact precautions and obtain relevant history as indicated.

- Assess patient upon arrival from a distance of at least six feet if possible.
  - Inquire specifically about C. difficile, MRSA history.
  - Look for evidence of infestation or large open draining wounds.

- Adjust infection prevention precautions as required based on symptoms, e.g., add protection for the eyes, nose, and mouth by using a mask and goggles or face shield when it is likely that there will be a splash or spray of any respiratory secretions or other body fluids (as defined in standard precautions).
  - Not all gastrointestinal (GI) illness requires contact precautions, but since norovirus and C. difficile (among others) do, consider maintaining contact precautions unless clearly not required (and can assume standard precautions at that point).

- Perform hand hygiene before and after patient care activities.

PPE

- Consider using a checklist to assist with proper donning and doffing.

- Report potential exposures according to existing service protocols.

Type:

- Disposable fluid-resistant gown that protects the provider’s legs; consider disposable fluid-resistant coveralls if there is a preference to stock and use one item or if there are concerns about provider leg coverage in the ambulance.
Contact Precautions

- Disposable gloves
- Ensure strict adherence to standard precautions based on situation (e.g., mask, goggles/face shield for splatter risk or airway interventions).

**Donning:**

1. Personal items (e.g., jewelry [including rings], watches, cell phones, pens) should ideally be removed and stowed. Long hair should be tied back. Eyeglasses should be secured with a tie.

2. Inspect PPE prior to donning to assure not torn or ripped, that all required supplies are available, and that correct sizes are selected for the healthcare worker (HCW).

3. Perform hand hygiene; allow hands to dry before moving to next step.

4. Put on gown or coverall. Ensure large enough to allow unrestricted movement.

5. Put on gloves. Ensure the cuffs are pulled over the sleeves of the gown or coverall and are tight.

6. After donning, the integrity of the ensemble should be verified. The HCW should go through a range of motions to ensure sufficient range of movement while all areas of the body remain covered.
Contact Precautions

Doffing:
Remove PPE only in an appropriate doffing area. Meticulous care should be taken to avoid self-contamination. PPE waste should be placed in a labeled leak-proof biohazard bag.

1. Inspect the PPE for visible contamination, cuts, or tears before removal. Disinfect any visible contamination with an EPA-registered hospital disinfectant wipe.

2. Inspect the glove outer surfaces for visible contamination, cuts, or tears.
   - Visible contamination, cut, or tear – If glove is visibly soiled, disinfect the glove with either an EPA-registered hospital disinfectant wipe in accordance with manufacturer recommendations or alcohol-based hand rub (ABHR)\(^5\), remove the gloves, and perform hand hygiene with ABHR on bare hands. If the glove is cut or torn, review your occupational exposure protocol.
   - No visible contamination, cuts or tears – Remove the gloves and perform hand hygiene with ABHR.

3. Remove gown or coverall and discard.
   - Gown – Depending on gown design and location of fasteners, the HCW can either untie or gently break fasteners. Avoid other contact with outer surface of gown during removal. Pull gown away from body, rolling inside out and touching only the inside of the gown.
   - Coverall – Tilt head back to reach zipper or fasteners. Unzip or unfasten completely before rolling down while turning inside out. Avoid other contact with outer surface of coverall during removal, touching only the inside of the coverall.

   • Dispose of gown or coverall into the biohazard bag.

---

\(^5\) Preliminary research suggests that multiple applications of some types of ABHR may affect nitrile and latex gloves. Switching the type of glove or ABHR product used is necessary if decreased glove integrity (e.g., they start to tear or rip) or unusual changes (e.g., they become sticky, shrink, or harden) that would affect work-related tasks are observed during training and practice.
Contact Precautions

4. Perform hand hygiene.
   • Visibly dirty, contaminated, or soiled with blood or body fluids – Wash hands with soap and water, then perform hand hygiene with ABHR.
   • Not visibly soiled – Perform hand hygiene with ABHR.

5. Inspect for any contamination of the HCW uniform. If there is contamination, secure the garment for cleaning. Contaminated clothing should be washed or discarded in accordance with disease-specific guidelines, generally with hot water, usual detergent, and the addition of household bleach.

PATIENT CARE CONSIDERATIONS

• Provide anti-emetics per service protocols.

• Anticipate additional stool/vomitus to reduce contamination of the HCW and the ambulance (emesis bags, towels available, and/or impermeable sheet placed on stretcher).

TRANSPORT CONSIDERATIONS

• Consider applying an impermeable barrier sheet to the patient to protect the HCW and environmental surfaces in the presence of excessive wound drainage, fecal incontinence, or other discharges.

• Patients on contact precautions should preferentially be transported to a private room.
Contact Precautions

AMBULANCE DECONTAMINATION

- Any visibly soiled surface must first be decontaminated using an EPA-registered hospital disinfectant according to directions on the label.
- Medical equipment (stethoscope, BP cuff, etc.) making patient contact should be disposable or cleaned and disinfected before use on another patient. Other visibly contaminated equipment should similarly be cleaned and disinfected.
- Confirmed or suspected C. difficile infection decontamination should utilize hypochlorite solutions. EPA-registered disinfectants with sporocidal activity may be sufficient, but limited data is available.

RESOURCES

- Considerations for Selecting Protective Clothing used in Healthcare for Protection against Microorganisms in Blood and Body Fluids
- Frequently Asked Questions about Clostridium difficile for Healthcare Providers
- Guidelines for Isolation Precautions 2007
Droplet Precautions

EXAMPLE DISEASES
Neisseria meningitidis • mumps • mycoplasma • streptococcal and many other causes of pneumonia • parvovirus • pertussis • pneumonic plague • rhinovirus • rubella • seasonal influenza • streptococcal pharyngitis

GOAL OF PRECAUTIONS
• Provide additional respiratory protection against inhalation of larger infectious droplets during direct patient care activities.

DISPATCH ACTIONS
• Resource assignment – usual assignment of first responders and appropriate BLS/ALS response except in infectious disease outbreak or epidemic situation consider restricting first responders if no life-threatening symptoms (chest pain, difficulty breathing, altered mental status) present
• Patient instructions – usual pre-arrival instructions (porch light, control animals, gather medications, etc.)
• Crew instructions – Advise responding crew of patient illness/symptoms.
Droplet Precautions

ARRIVING EMS ACTIONS/CONSIDERATIONS

- Be aware of any community-based outbreaks of influenza or other epidemic disease requiring droplet precautions and obtain relevant history as indicated.
- Assess patient upon arrival from a distance of at least six feet if possible.
  » Inquire specifically about influenza or other specific exposures.
- Adjust infection prevention precautions as required based on symptoms/history. Maintain strict adherence to standard precautions.
- Perform hand hygiene before and after patient care activities.

PPE

- Consider using a checklist to assist with proper donning and doffing.
- PPE should be removed in an appropriate doffing area to prevent secondary contamination. Meticulous care should be taken to avoid self-contamination. PPE waste should be placed in a labeled leak-proof container.
- Report potential exposures according to existing service protocols.

Type:

- Disposable surgical mask (N95 respirator not required)
- Disposable gloves
- Eye protection – cleanable goggles or disposable face shield
Droplet Precautions

Donning:

1. Select gloves and mask and inspect to ensure not torn or ripped and that the correct size is selected.
2. Perform hand hygiene with ABHR; allow hands to dry before moving to next step.
3. Put on gloves.
5. Put on surgical mask.

6 Per CDC, no recommendation for routinely wearing eye protection, but influenza and other diseases can transmit via the ocular surfaces as well as other mucous membranes. Use PPE to protect the mucous membranes of the eyes, nose, and mouth during procedures and patient-care activities that are likely to generate splashes or sprays of blood, body fluids, secretions, and excretions. Select masks, goggles, face shields, and combinations of each according to the need anticipated by the task performed.
**Droplet Precautions**

**Doffing:**
Care should be taken to avoid self-contamination when removing mask and gloves. Place all PPE waste in a labeled leak-proof biohazard bag.

1. Inspect PPE for visible contamination, cuts, or tears before starting to remove. If any PPE is visibly contaminated, disinfect with an EPA-registered hospital disinfectant wipe in accordance with manufacturer recommendations.

2. Remove and discard gloves, taking care not to contaminate hands when removing the gloves. Dispose of gloves in biohazard bag.

3. Remove eye protection: Remove by strap, avoid touching the front surface of the eye protection. Discard in biohazard bag. Perform hand hygiene with ABHR. Reusable goggles must be thoroughly cleansed with EPA-registered hospital disinfectant wipes.

4. Remove the surgical mask by tilting the head slightly forward, grasping the elastic straps, sliding them off the ears/head, and removing the mask without touching the front fabric. Discard the mask into the biohazard bag.

5. Perform hand hygiene: If hands are visibly dirty, or soiled with blood or body fluids or other material, wash hands with soap and water, then perform hand hygiene with ABHR. If hands are not visibly soiled, simply perform hand hygiene with ABHR.

6. The HCW should inspect for any contamination of their uniform. If there is contamination, remove the soiled garment and secure it for cleaning. Contaminated clothing should be washed or discarded in accordance with disease-specific guidelines, generally with hot water, usual detergent, and the addition of household bleach.
Droplet Precautions

PATIENT CARE CONSIDERATIONS

- Provide a surgical mask for all patients with acute infectious respiratory symptoms who can tolerate it.
- Provide tissues to patients for secretion control and encourage patient hand hygiene and cough etiquette practices.
- Personnel not in appropriate PPE should maintain a distance of at least 6 feet from the patient and should wear gloves to guard against infectious agents on the surfaces of objects close to the patient.
- Minimize use of nebulizers to decrease droplet generation; consider metered dose inhalers.
- Minimize airway interventions that may cause coughing (e.g., suctioning) to degree possible.

TRANSPORT CONSIDERATIONS

- Standard transportation
- Consider having the patient compartment exhaust vent on high and isolating the driver compartment if performing aerosol producing procedures (airway suctioning, intubation, aerosolized medication administration). Increase ventilation by having air or heat on non-recirculating cycle and/or opening windows.
- Advise receiving hospital of respiratory symptoms – private (but not negative pressure) room preferred.
Droplet Precautions

AMBULANCE DECONTAMINATION

- Any visibly soiled surface must first be decontaminated using an EPA-registered hospital disinfectant according to directions on the label.
- Disinfect all potentially contaminated/high touch surfaces including the stretcher with an EPA-registered hospital disinfectant according to directions on the label.
- Medical equipment (stethoscope, BP cuff, etc.) making patient contact should be disposable or cleaned and disinfected before use on another patient.

RESOURCES

Guidelines for Isolation Precautions 2007
Airborne Precautions

EXAMPLE DISEASES
- measles
- monkeypox
- TB (suspected or confirmed pulmonary or laryngeal)
- varicella (chickenpox)

GOAL OF PRECAUTIONS
- Provide respiratory protection against inhalation of infectious aerosols (agents that remain infectious over long distances when suspended in the air).

DISPATCH ACTIONS
- Resource assignment – Consider restricting assignment to ambulance only if no life-threatening symptoms (chest pain, difficulty breathing, altered mental status) present and high suspicion for airborne disease in order to decrease first responder exposure.
- Patient instructions – usual pre-arrival instructions (porch light, control animals, gather medications, etc.)
- Crew instructions – Advise responding crew of patient illness/symptoms and concern for airborne infection.
Airborne Precautions

ARRIVING EMS ACTIONS/CONSIDERATIONS

- Be aware of any community-based outbreaks of TB, measles, or other disease requiring airborne precautions and obtain relevant history as indicated.

- Assess patient upon arrival from a distance of at least six feet if possible.
  - Inquire specifically about TB, measles or other relevant exposures.

- Adjust infection prevention precautions as required based on symptoms. Change to standard precautions if no significant concern for airborne. Maintain strict adherence to standard precautions.

- Perform hand hygiene before and after patient care activities.

PPE

- Consider using a checklist to assist with proper donning and doffing.
- Report potential exposures according to existing service protocols.

Type:
- Disposable NIOSH-approved, fit-tested N95 respirator.
  - EMS agencies often use powered air purifying respirators (PAPRs) with full hood and high efficiency particulate air (HEPA) filter for airborne precautions for employees that cannot safely fit test on N95 respirators due to facial hair, facial structure, etc.
  - For the purposes of consistency and simplicity, the use of respirators for all infectious agents known to be transmitted by infectious aerosols is recommended.
- Disposable exam gloves
Airborne Precautions

Donning:
1. Inspect PPE prior to donning to ensure that it is in serviceable condition (e.g., gloves not torn or ripped, respirator not soiled or creased; if using PAPR, check motor and airflow) and that correct size is selected.
2. Perform hand hygiene with ABHR; allow hands to dry before donning gloves.
3. Put on gloves.
4. Put on respirator.
   - N95 or elastomeric respirator – Apply mask, mold to nose/face, and perform fit check to assure intact seal.
   - PAPR – Turn on PAPR motor, apply hood assuring inner and outer liner drape smoothly over shoulders, and adjust headband to comfort.

Doffing:
PPE should be doffed in an appropriate removal area (particularly if using a PAPR). Care should be taken to avoid self-contamination during removal. Place all PPE waste in a labeled, leak-proof biohazard bag. PAPR should be placed in a separate biohazard bag and/or managed by service protocol.
1. Inspect glove outer surfaces for visible contamination, cuts, or tears.
   - Visible contamination, cut, or tear – If a glove is visibly soiled, then disinfect the glove with either an EPA-registered hospital disinfectant wipe or ABHR, in accordance with manufacturer recommendations, remove the gloves, dispose in biohazard bag, perform hand hygiene with ABHR on bare hands. If the glove is cut or torn, inspect the underlying skin. If any break in the skin, contact your supervisor and follow your service exposure guidelines.
   - No visible contamination, cuts or tears – Remove and discard gloves, taking care not to contaminate hands during removal. Dispose of gloves in biohazard bag. Perform hand hygiene with ABHR.
Airborne Precautions

2. Respirator

- Remove N95 respirator mask tilting the head slightly forward, grasping the elastic straps, sliding them off the ears/head, and removing the mask without touching the front fabric. Discard mask into the biohazard bag.

- Elastomeric half-face respirator – Reapply clean gloves, remove mask by straps, wipe surface with EPA-registered hospital disinfectant wipe, allow to dry. Remove gloves and perform hand hygiene with ABHR.

- PAPR with External Belt-Mounted Blower (if used): Remove PAPR belt and set PAPR down in front of you. Lean forward, grasp top of hood (avoid grabbing hose), slowly remove hood by pulling off and straight down to floor. Retain the belt-mounted blower unit and reusable PAPR components in a separate bag for disinfection (must be wiped down with EPA-registered hospital disinfectant wipes and allowed to air dry).

3. Perform hand hygiene.

- Visibly dirty, contaminated, or soiled with blood or body fluids – Wash hands with soap and water, then perform hand hygiene with ABHR.

- Not visibly soiled – Perform hand hygiene with ABHR.

4. Inspect for any contamination of the HCW uniform. If there is contamination, secure the garment for cleaning. Contaminated clothing should be washed or discarded in accordance with disease-specific guidelines, generally with hot water, usual detergent, and the addition of household bleach.
PATIENT CARE CONSIDERATIONS

- Ensure strict adherence with standard precautions (e.g., add gown or coverall for significant bodily fluid exposures and follow doffing for contact precautions).

- Ask the patient to wear a surgical mask (N95 respirator not required) if they are able to tolerate it.

- Provide tissues to patients for secretion control and encourage patient hand hygiene and cough etiquette practices.

- The performance of procedures that can generate small particle aerosols (aerosol-generating procedures), such as endotracheal intubation and open suctioning of the respiratory tract, have been associated with transmission of infectious agents to healthcare personnel, including M. tuberculosis. Protection of the eyes, nose, and mouth – in addition to gown and gloves – is recommended during performance of these procedures in accordance with Standard Precautions. Use of an N95 respirator is recommended during aerosol-generating procedures when the aerosol is likely to contain M. tuberculosis.

- If clinically indicated and available, rapid sequence intubation should be considered for patient requiring definitive airway management to avoid aerosol production as a consequence of coughing.

TRANSPORT CONSIDERATIONS

- Notify the receiving hospital of the need for an airborne infection isolation room (AIIR) for patient placement.

- Consider having the patient compartment exhaust vent on high and isolating the driver compartment from the patient compartment. Consider having the driver compartment ventilation fan set to high without recirculation.

- If driver/pilot compartment is not isolated from the patient compartment, vehicle operator to wear NIOSH-approved, fit-tested N95 respirator.

- Patients who are intubated should be ventilated with a bag-valve device or ventilator equipped with a HEPA filter on exhalation port.
Airborne Precautions

**AMBULANCE DECONTAMINATION**

- Any visibly soiled surface must first be decontaminated using an EPA-registered hospital disinfectant according to directions on the label.
- Disinfect all potentially contaminated/high touch surfaces including the stretcher with an EPA-registered hospital disinfectant according to directions on the label.
- Medical equipment (stethoscope, BP cuff, etc.) making patient contact should be disposable or cleaned and disinfected before use on another patient.

**RESOURCES**

- Guideline for Isolation Precautions: Preventing Transmission of Infectious Agents in Healthcare Settings
- Respiratory Protection Standards
Special Respiratory Precautions

EXAMPLE DISEASES
Severe acute respiratory syndrome (SARS) • MERS • novel influenza strains (e.g., H7N9) • smallpox

GOAL OF PRECAUTIONS
• Provide respiratory protection against inhalation of infectious aerosols (infectious agents that remain infectious over long distances when suspended in the air) as well as impermeable barrier to reduce spread of highly pathogenic viruses on surfaces and via fomites during direct patient care activities (standard + contact + airborne).
Special Respiratory Precautions

DISPATCH ACTIONS

• In addition to travel history to affected countries, may need to introduce screening questions based on local cases.

• Resource assignment – Consider restricting assignment to ambulance only if no life-threatening symptoms (chest pain, difficulty breathing, altered mental status) present in order to decrease first responder exposure. Many communities will also have dedicated infectious disease medical transport services built into their regional transportation plan for planned movement of patients with special respiratory disease.

• Patient instructions – Usual pre-arrival instructions (porch light, control animals, gather medications, etc.). Request family member to meet arriving personnel at door.

• Crew instructions – Advise responding crew of patient illness/symptoms and concern for special pathogen.
ARRIVING EMS ACTIONS/CONSIDERATIONS

- Be aware of any community-based outbreaks of SARS/MERS/novel influenza type diseases or other disease requiring special precautions and obtain relevant travel and exposure history as indicated.

- Assure appropriate training and education on PPE use and patient management.

- “Doorway evaluation” if possible – If stable and verbal, minimize contact with while caregiver dons appropriate PPE.

- Assure history consistent with dispatch.
  - Inquire specifically about travel and relevant exposures.

- Adjust infection prevention precautions as required based on symptoms. Change to standard precautions if no significant concern for special pathogen. Maintain strict adherence to standard precautions.

- For special pathogens, minimize number of direct caregivers.

- Perform hand hygiene before and after all patient care activities.

PPE

Type:

- Disposable NIOSH-approved, fit-tested N95 or equivalent/higher level respirator (e.g., re-usable half-face elastomeric respirator N95 or higher rating mask or PAPR with full hood and HEPA filter)

- Disposable face shield or disposable or cleanable goggles (if not using hooded PAPR)

- Disposable fluid-resistant gown that extends to at least mid-calf or disposable fluid-resistant coveralls

- Disposable gloves with extended cuffs (strongly consider double-gloving)

- Disposable boot/shoe covers
Special Respiratory Precautions

**Donning:**

1. Personal items (e.g., jewelry [including rings], watches, cell phones, pagers, pens) should ideally be removed and stowed. Long hair should be tied back. Eyeglasses should be secured with a tie.

2. Inspect PPE prior to donning to ensure that it is in serviceable condition (e.g., gloves not torn or ripped, respirator not soiled or creased, if using PAPR check motor and airflow) and that correct size is selected.

3. Perform hand hygiene with ABHR; allow hands to dry before donning gloves.

4. Put on first pair of gloves (assume double-gloving).

5. Put on gown or coverall. Ensure large enough to allow unrestricted movement. Ensure cuffs of inner gloves are tucked under the sleeve of the gown or coverall.

7. Put on outer gloves. Ensure the cuffs are pulled over the sleeves of the gown or coverall and are tight. Consider taping, if required.

8. Put on respirator.
   - N95 or elastomeric respirator – Apply mask, mold to nose/face, perform fit check to assure intact seal; apply face shield if not using goggles.
   - PAPR – Turn on PAPR motor, apply hood assuring inner liner (if equipped) is tucked into coverall (if used) and outer liner drapes smoothly over shoulders and adjust headband to comfort.

9. If not using hooded PAPR, apply full face shield or goggles.

10. After donning, the integrity of the ensemble should be verified by the HCW. The HCW should go through a range of motions to ensure sufficient range of movement without suit binding/stretching while all areas of the body remain covered.
Special Respiratory Precautions

Doffing:

PPE should be doffed in a designated removal area, particularly when using a PAPR. Care should be taken to avoid self-contamination during removal. Place all PPE waste in a labeled, leak-proof biohazard bag. PAPR should be placed in a separate biohazard bag and/or managed by service protocol.

1. Inspect the PPE for visible contamination, cuts, or tears before removal. Disinfect any visible contamination with an EPA-registered hospital disinfectant wipe.

2. Disinfect outer-gloved hands with either an EPA-registered hospital disinfectant wipe in accordance with manufacturer recommendations or ABHR. Remove and discard outer gloves into biohazard bag, taking care not to contaminate inner gloves in the process.

3. Inspect the inner glove outer surfaces for visible contamination, cuts, or tears.
   - Visible contamination, cut, or tear – If an inner glove is visibly soiled, then disinfect the glove with either an EPA-registered hospital disinfectant wipe or ABHR, remove the inner gloves, perform hand hygiene with ABHR on bare hands, and don a new pair of gloves. If the inner glove is cut or torn, check the underlying skin and review your occupational exposure protocol with your supervisor.
   - No visible contamination, cuts or tears – Disinfect the inner gloves with either an EPA-registered hospital disinfectant wipe or ABHR.

4. Remove gown or coverall and boot/shoe covers and discard.
   (Note: Gown or coverall should be removed before face protection and respirator. If that is not possible due to the design of the PPE, remove the gown or coverall after face protection and respirator.)
   - Gown – Depending on gown design and location of fasteners, the HCW can either untie or gently break fasteners. Avoid contact with outer surface of gown during removal. Pull gown away from body, rolling inside out and touching only the inside of the gown.
Special Respiratory Precautions

- Coverall – Tilt head back to reach zipper or fasteners. Unzip or unfasten completely before rolling down while turning inside out. Avoid contact with outer surface of coverall during removal, touching only the inside of the coverall.

- Dispose of gown or coverall into the biohazard bag.

5. Disinfect gloves with either an EPA-registered hospital disinfectant wipe or ABHR.

6. Remove goggles or face shield (if used) sliding fingers under straps and sliding up and off away from face. Do not touch the front surface of the goggles/shield. Discard into biohazard bag. If re-using goggles must clean all surfaces with EPA-approved disinfesting wipes.

7. Disinfect gloves with either an EPA-registered hospital disinfectant wipe or ABHR.

8. Respirator

   - N95 respirator: Tip head slightly forward, remove by sliding fingers under the elastic straps and sliding them off the ears/head allowing the mask to fall away from the face being careful not to touch the front of the mask. Discard into the biohazard bag.

   - Elastomeric half-face respirator: Remove mask by straps without touching the front surface of the mask, wipe surface with EPA-approved hospital disinfectant cloth, allow to dry.

   - PAPR with External Belt-Mounted Blower: Remove PAPR belt and set PAPR down in front of you. Lean forward, grasp top of hood, (avoid grabbing hose), slowly remove hood by pulling off and straight down to floor. Retain the belt-mounted blower unit and reusable PAPR components in a designated bag or area for disinfection in accordance with manufacturer instructions (must be wiped down with EPA-approved hospital disinfectant and allowed to air dry.

9. Disinfect inner-gloved hands with either an EPA-registered hospital disinfectant wipe or ABHR. Remove and discard gloves, taking care not to contaminate bare hands during removal process. Dispose of inner gloves into the biohazard bag.
Special Respiratory Precautions

   - Visibly dirty, contaminated, or soiled with blood or body fluids – Wash hands with soap and water, then perform hand hygiene with ABHR. Refer to the Occupational/Health Exposures information in the Resources/Special Considerations section for additional guidance to ensure that occupational health is aware of potential exposure.
   - Not visibly soiled – Perform hand hygiene with ABHR.

11. HCW should inspect for any contamination of their uniform. If there is contamination, remove and secure garment for cleaning. Contaminated clothing should be washed or discarded in accordance with disease-specific guidelines, generally with hot water, usual detergent, and the addition of household bleach.

PATIENT CARE CONSIDERATIONS

- Ask the patient to wear a surgical mask (N95 respirator not required) if they are able to tolerate it.
- Provide tissues to patients for secretion control and encourage patient hand hygiene and cough etiquette practices.
- Exercise caution when performing aerosol-producing procedures (endotracheal intubation, airway suctioning, administration of nebulized medication, CPAP/BiPAP, CPR). Only perform these procedures if medically necessary and cannot be postponed.
- If clinically indicated and available, rapid sequence intubation should be considered for patient requiring definitive airway management to avoid aerosol production from coughing.
- Patients who are intubated should be ventilated with a bag-valve device or ventilator with a HEPA filter on the exhalation port.
Special Respiratory Precautions

TRANSPORT CONSIDERATIONS

- Notify the receiving hospital of the need for an AIIR room for patient placement.
- The patient compartment exhaust vent should be on high and the driver compartment should be isolated from the patient compartment if possible. The driver compartment ventilation fan should be set to high without recirculation.
- The vehicle operator should wear a NIOSH-approved, fit-tested N95 respirator if the patient compartment and cab cannot be isolated.
- For persons under investigation for smallpox or novel influenza, consider transport by portable isolation unit or ambulance preparation as described for EVD-VHF Precautions.
- EMS agencies should have a plan for family members wishing to accompany the patient that prevents crew exposures to highly infectious diseases and includes a procedure to contact the appropriate public health authority for further information or actions.

AMBULANCE DECONTAMINATION

- Any visibly soiled surface must first be decontaminated using an EPA-registered hospital disinfectant according to directions on the label.
- Disinfect all potentially contaminated surfaces including the stretcher with an EPA-registered hospital disinfectant according to directions on the label.
- Medical equipment (stethoscope, BP cuff, etc.) making patient contact should be disposable or cleaned and disinfected using appropriate disinfectants before use on another patient.
Special Respiratory Precautions

RESOURCES

+ Considerations for Selecting Protective Clothing used in Healthcare for Protection against Microorganisms in Blood and Body Fluids

+ Interim Guidance for Infection Control Within Healthcare Settings When Caring for Confirmed Cases, Probable Cases, and Cases Under Investigation with Novel Influenza A Viruses Associated with Severe Disease

+ Middle East Respiratory Syndrome (MERS)
EVD/VHF Precautions

EXAMPLE DISEASES
EVD • Marburg virus • Lassa fever • Crimean-Congo fever

GOAL OF PRECAUTIONS
• Provide maximal impermeable barrier and respiratory protection against highly pathogenic VHF viruses.

DISPATCH ACTIONS
1. Inquire about travel and direct exposure history within the previous 21 days.
   • Has patient traveled to or lived in a country with hemorrhagic fever virus transmission?
   • Has patient had direct contact with a person who is confirmed or suspected to have EVD/VHF? (including local cases, if applicable)
     » If yes, does the patient have any fever, severe headache, muscle pain, weakness, fatigue, diarrhea, vomiting, abdominal (stomach) pain, or unexplained hemorrhage (bleeding or bruising)?
EVD/VHF Precautions

• Notify responding units of any affirmative answer to these questions. Provide guidance below/ask crew to reference guidance and cancel first responder units if no life-threatening symptoms (unconscious/altered mental status, difficulty breathing, chest pain).

2. Instructions to patients and EMS providers for EVD/VHF positive screen:

• Instruct other people at the scene to restrict contact with patient unless wearing appropriate PPE. Provide usual pre-arrival instructions (porch light, control animals, gather medications, etc.) Request family member to meet arriving personnel at door. Ask family to assure clean clothing for the patient prior to EMS arrival, if possible.

• Alert any first responders (if required for emergent symptoms) and EMS providers being dispatched of potential for a patient with possible exposure/signs and symptoms of EVD/VHF before they arrive on scene. This may best be done via computer-aided dispatch (CAD), text messaging, or other secure means.

• Advise EMS providers to apply appropriate PPE before direct contact with the patient.
  » Advise EMS providers before entering the scene to wear the highest level of PPE recommended if complaints include bleeding, vomiting, or diarrhea.

• If responding to an airport or other port of entry to the United States, dispatch should notify the Centers for Disease Control and Prevention (CDC) Quarantine Station for the port of entry. Contact information for CDC Quarantine Stations can be accessed at http://www.cdc.gov/quarantine/quarantinestationcontactlistfull.html.

• Dispatch should notify the local or state public health authority if a suspect case is transported to a hospital.

• Dispatch should notify EMS supervisor and others per service protocols.

• Alert EVD/VHF specialized EMS ambulance if available as secondary responder and the patient is stable enough to await this resource.
ARRIVING EMS ACTIONS/CONSIDERATIONS

• Be aware of any international and/or community-based outbreaks of EVD/VHF and obtain relevant history as indicated regardless of dispatch information.

• Assure appropriate training and education on PPE use and patient management.

• Consider the strategy of one provider putting on PPE with the use of a trained observer and managing the patient while the other provider does not engage in patient care, but provides the “doorway evaluation” and communications/charting from at least 6 feet away from the patient. The second provider should be prepared to quickly don the appropriate PPE should the first provider require assistance.

• Assure history consistent with dispatch.
  » Inquire specifically about travel and relevant exposures.
  » If initial assessment confirms suspect case of EVD/VHF and patient is stable and alert, then continue specialized EMS ambulance response to your location, if available.

• Adjust infection prevention precautions as required based on symptoms. Change to standard precautions guideline if no significant concern for special pathogen. Maintain strict adherence to standard precautions.

• Minimize number of direct caregivers.

• Perform hand hygiene before and after all patient care activities.

• Assure that appropriate ALS/BLS care is provided. The vast majority of cases identified as suspect will not have EVD/VHF.
EVD/VHF Precautions

PPE

Initial responders to suspect case without active bleeding, vomiting, or diarrhea

Donning:

1. Use a checklist and a trained observer.
2. Personal items (e.g., jewelry [including rings], watches, cell phones, pagers, pens) should be stowed. Long hair should be tied back. Eye glasses should be secured with a tie.
3. Visually inspect the PPE to ensure that it is not torn or ripped, all required PPE and supplies are available, and that the correct sizes are selected.
4. Perform Hand Hygiene: Perform hand hygiene with ABHR. When using ABHR, allow hands to dry before moving to next step.
5. Put on inner gloves.
6. Put on gown or coverall. Ensure gown or coverall is large enough to allow unrestricted movement. Ensure cuffs of inner gloves are tucked under the sleeve cuff.
7. Put on surgical mask.
8. Put on second pair of gloves (with extended cuffs). Ensure the cuffs are pulled over the sleeves of the gown or coverall.
9. Put on face shield: Put on full face shield over the surgical mask to protect the eyes, as well as the front and sides of the face. Consider use of a head cover.
10. Verify the integrity of the ensemble (e.g., there should be no cuts or tears in the PPE). The HCW should be comfortable and able to extend the arms, bend at the waist, and go through a range of motions while all areas of the body remain covered.

For U.S. Healthcare Settings: Donning and Doffing Personal Protective Equipment (PPE) for Evaluating Persons Under Investigation (PUIs) for Ebola Who Are Clinically Stable and Do Not Have Bleeding, Vomiting, or Diarrhea
EVD/VHF Precautions

**Doffing:**

PPE should be doffed in a designated PPE removal area. Meticulous care should be taken during this process to avoid self-contamination as this is the major contributor to HCW disease. Place all PPE waste in a labeled leak-proof biohazard bag.

1. Use a checklist and a trained observer.

2. Inspect the PPE for visible contamination, cuts, or tears before starting to remove. If any visible contaminant, disinfect using an EPA-registered hospital disinfectant wipe.

3. Disinfect outer-gloved hands with either an EPA-registered hospital disinfectant wipe in accordance with manufacturer recommendations or ABHR. Remove and discard outer gloves, taking care not to contaminate inner gloves in the process. Dispose of outer gloves into biohazard bag.

4. Inspect the inner glove outer surfaces for visible contamination, cuts, or tears.
   - Visibly soiled, cut or tear – Disinfect the glove with either an EPA-registered hospital disinfectant wipe or ABHR, remove the inner gloves, and discard into biohazard bag, perform hand hygiene with ABHR on bare hands, and don a new pair of gloves. For cut or tear, inspect skin for injury and report potential exposure immediately to supervisor.
   - No visible contamination and no cuts or tears – Disinfect the inner gloves with either an EPA-registered hospital disinfectant wipe or ABHR.

5. Remove the face shield (and head cover/hood if used) by tilting the head slightly forward, grabbing the rear strap, and pulling it over the head, allowing the face shield to fall forward. Avoid touching the front surface of the face shield. Discard the face shield into the designated biohazard bag.

6. Disinfect inner gloves with either an EPA-registered hospital disinfectant wipe or ABHR.
EVD/VHF Precautions

7. Remove gown or coverall.
   - Gown – Depending on gown design and location of fasteners, either untie or gently break fasteners. Avoid contact with outer surface of gown during removal. Pull gown away from body, rolling inside out and touching only the inside of the gown.
   - Coverall – Tilt head back to reach zipper or fasteners. Unzip or unfasten coverall completely before rolling down while turning inside out. Avoid contact with outer surface of coverall during removal, touching only the inside of the coverall.
   - Dispose of gown or coverall into the biohazard bag.

8. Disinfect inner gloves with either an EPA-registered hospital disinfectant wipe or ABHR, remove and discard gloves, taking care not to contaminate bare hands during removal.

9. Perform hand hygiene with ABHR and don a new pair of gloves.

10. Remove the surgical mask by tilting the head slightly forward, grasping the elastic straps, and pull the straps off the ears and/or top of head to release the mask allowing it to fall forward off the face. Avoid touching the front of the mask. Discard mask into the biohazard bag.

11. Disinfect gloved hands with either an EPA-registered hospital disinfectant wipe or ABHR. Remove and discard gloves, taking care not to contaminate bare hands during removal process. Dispose of inner gloves into the biohazard bag.

12. Perform hand hygiene with ABHR.

13. Inspect for any contamination of the HCW uniform. If there is contamination, remove the soiled garment and place it into the biohazard bag, cleanse skin with ABHR and immediately inform your supervisor of the potential exposure.
PPE

Transport of confirmed case or those with active bleeding, vomiting, or diarrhea

Note: Services may elect to use NIOSH-approved, fit-tested N95 respirator in combination with impermeable hood that covers head and shoulders and a full face shield. The above PPE section may be modified for use of this ensemble. This section covers donning/doffing with PAPR with impermeable drape-style hood. Services may elect to add a heavier impermeable apron for high-risk situations.

Donning:

1. Identify trained observer and use a checklist.
2. Ensure hydration and use the restroom if possible.
3. Personal items (e.g., jewelry [including rings], watches, cell phones, pagers, pens) should ideally be stowed. Long hair should be tied back. Eye glasses should be secured with a tie.
4. Visually inspect the PPE ensemble to ensure it is in good condition (e.g., not torn or ripped), all required PPE and supplies are available, and correct sizes selected. Test the PAPR motor and airflow, check that the filters fit securely, and ensure all filter caps are off.
5. Don and test two-way radio headset microphone (if using).
6. Perform hand hygiene with ABHR; allow hands to dry before moving to next step.
7. Put on first pair of gloves.
8. Put on coverall, ensure unrestricted movement. Ensure cuffs of inner gloves are tucked under the sleeve cuff.

---

Guidance on Personal Protective Equipment (PPE) To Be Used By Healthcare Workers during Management of Patients with Confirmed Ebola or Persons under Investigation (PUIs) for Ebola who are Clinically Unstable or Have Bleeding, Vomiting, or Diarrhea in U.S. Hospitals, Including Procedures for Donning and Doffing PPE
EVD/VHF Precautions

9. Put on impermeable boots, pull coverall material over top of boot and tape (leaving tab). If using boot covers per service protocols, put on boot covers.

10. Put on second pair of gloves (with extended cuffs). Ensure the cuffs are pulled over the sleeves of the coverall.

11. Turn PAPR on and put on belt and then hood. Assure inner hood (if present) is tucked into coverall and outer hood drapes over shoulders. Assure comfortable airflow and adjust headband if required.

12. Put on disposable apron, if using.

13. Observer and HCW should verify the integrity of the ensemble (e.g., there should be no cuts or tears in the PPE). The HCW should be comfortable and able to extend the arms, bend at the waist, and go through a range of motions without stressing or binding the coverall.

Doffing:

PPE should be doffed in a designated PPE removal area. Meticulous care should be taken during this process to avoid self-contamination as this is the major contributor to HCW disease. Place all PPE waste in a labeled leak-proof biohazard bag.

1. Identify a trained observer and use a checklist.

2. Inspect the PPE for visible contamination, cuts, or tears before starting to remove. If any visible contaminant, disinfect using an EPA-registered hospital disinfectant wipe.

3. Disinfect outer gloves with EPA-registered hospital disinfectant or ABHR.

4. Remove apron if using (e.g., by breaking or untying neck strap and releasing waist ties) and roll the apron away from you, containing the soiled outer surface as you roll; discard apron into biohazard bag being careful not to contact other surfaces. Re-inspect underlying coverall.
EVD/VHF Precautions

5. Disinfect outer-gloved hands with either an EPA-registered hospital disinfectant wipe in accordance with manufacturer recommendations or ABHR. Remove and discard outer gloves, taking care not to contaminate inner gloves in the process. Dispose of outer gloves into biohazard bag.

6. Inspect the inner gloves’ outer surfaces for visible contamination, cuts, or tears.

   • Visibly soiled, cut or tear – Disinfect the glove with either an EPA-registered hospital disinfectant wipe or ABHR, remove the inner gloves and discard into biohazard bag, perform hand hygiene with ABHR on bare hands, and don a new pair of gloves. For cut or tear, inspect skin for injury and report any potential exposure immediately to supervisor.

   • No visible contamination and no cuts or tears – Disinfect the inner gloves with either an EPA-registered hospital disinfectant wipe or ABHR.

7. Remove PAPR with External Belt-Mounted Blower: Remove PAPR belt and set PAPR down in front of you. Lean forward, grasp top of hood (avoid grabbing hose), slowly remove hood by pulling off and straight down to floor.

8. Retain the belt-mounted blower unit and reusable PAPR components in a separate bag for disinfection.

9. Disinfect inner gloves with either an EPA-registered hospital disinfectant wipe or ABHR.

10. Remove coverall.

   • Tilt head back to reach zipper or fasteners. Unzip or unfasten coverall completely and release tape at boot cuff.

   • Avoid contact with outer surface of coverall during removal, touching only the inside of the coverall as you slide your hands down the inside of the suit, rolling it inside-out as you go.

   • Step out of boots onto clean surface.
EVD/VHF Precautions

- Boots Disposable – Discard both boots and coverall into biohazard bag.
- Boots Re-usable – After stepping out of boots, dispose of coverall into biohazard bag, then place boots into separate bag for later decontamination.

11. Disinfect inner-gloved hands with either an EPA-registered hospital disinfectant wipe or ABHR. Remove and discard gloves, taking care not to contaminate bare hands during removal. Dispose of inner gloves into the biohazard bag.

12. Perform hand hygiene with ABHR.

13. Observer and HCW inspect for any contamination of their uniform. If there is contamination, remove the soiled garment and place it into a leak-proof biohazard bag, cleanse skin with ABHR and inform the supervisor of potential exposure.

14. Step into clean area.

PATIENT CARE CONSIDERATIONS

- Ask the patient to wear a surgical mask (N95 respirator not required) if they are able to tolerate it.
- Advise the designated receiving hospital as early as possible about a suspect case to allow them preparation time.
- The biggest risk to the patient is withholding appropriate treatment from suspect EVD/VHF patients, as few will actually have the disease.
- The more body fluids, the higher the transmission risk.
- Anticipate additional stool/vomitus to reduce contamination of the HCW and the ambulance (emesis bags, towels, and/or impermeable sheet placed on stretcher).
EVD/VHF Precautions

- Minimize the number of HCWs who make patient contact.
- Dedicated medical equipment (ideally disposable) should be used for the provision of patient care whenever possible.
- If patient is ambulatory, strongly consider a barrier garment, surgical mask and gloves if tolerated.
- If patient is having large volumes of diarrhea, patient should wear an adult undergarment.
- If patient is non-ambulatory, the patient may be comfortably shrouded in a barrier sheet, and surgical mask applied.
- Exercise caution when performing aerosol-producing procedures (endotracheal intubation, airway suctioning, administration of nebulized medication, CPAP/BiPAP, CPR). Only perform these procedures if medically necessary and cannot be postponed. Note that cardiac arrest early in the illness may be due to electrolyte imbalance and may be survivable. Late cardiac arrest from multi-organ failure likely carries a dismal prognosis.
- Do not perform phlebotomy or any other invasive procedures unless urgently required for patient care or stabilization. Handle any needles and sharps with extreme care and dispose in puncture-proof, sealed containers that are specific to the single patient. Do not dispose of used needles and sharps in containers that have sharps from other patients in them.
- Consider giving oral or nasal medicine to reduce nausea and/or pain per service protocols rather than injectable.
- Responders may use hands-free communications devices (e.g., tactical head sets) inside the PPE ensemble to facilitate communication and avoid contamination of radios.
- Charting is either verbal to a partner in a clean area or completed after transport.
EVD/VHF Precautions

TRANSPORT CONSIDERATIONS – GENERAL

- If the patient is a highly suspect case and stable, consider specialized ambulance preparation and transport (see below) if time and acuity allow.
- Confirmed case or interfacility transport should be performed by EMS personnel with properly prepared ambulances (see below).
- For emergency transport, consider applying an impermeable barrier sheet or cocoon to the patient to protect the HCW and environmental surfaces in the presence of incontinence, draining wounds, or other discharges.
- The driver’s compartment should remain clean! No family members or belongings in the driver’s compartment!
- Suspect EVD/VHF cases should be transported to a designated regional hospital capable of evaluation and initial management and arrived into a dedicated isolation room.
- Consider deferring ambulance decontamination for a brief period to see if EVD/VHF can be quickly ruled out during initial hospital assessment.
- Formal decontamination after transport of a suspect/confirmed case should occur in a designated area by designated personnel as below.
- EMS agencies should have a plan for family members wishing to accompany the patient that prevents crew exposures to highly infectious diseases and includes a procedure to contact the appropriate public health authority for further information or actions.
EVD/VHF Precautions

SPECIALIZED AMBULANCE PREPARATION/ INTERFACILITY TRANSFER

Assumptions:
- All involved HCWs (hospital and out-of-hospital) have received education and training and demonstrated competencies for EVD/VHF PPE and patient management.
- Healthcare facilities and transporting ambulance agencies have protocols for the management of patients, exposures, and ambulance preparation and decontamination.
- Facilities and transporting ambulance agencies conduct exercises to evaluate their integration.

Prior to Transport
- Ensure you have points of contact and means of communication with sending facility, receiving facility, public health authority, emergency management, law enforcement (or agency providing security for the transport), and (if applicable) aviation and hazardous materials management and disposal.
- Consider notifying your agency’s public affairs official.
- Consider secure methods of communication to avoid monitoring by the media or public.
- Communicate with the sending facility to confirm patient’s clinical condition and risk of contact with infectious body fluids (bleeding, vomiting, diarrhea, etc.).
- Determine if the patient will be ambulatory or non-ambulatory.
- Confirm whether additional passengers are being transported (family, etc.).

---

9 Adapted from Standard Operating Procedure (SOP) for Patient Handoff between a Healthcare Facility and a Transporting Ambulance.
EVD/VHF Precautions

- Ensure adequate inventory of supplies and appropriately sized PPE for the personnel who are assigned to the transport mission using checklists.
- Ensure procedures and training to limit contamination of ambulance environmental surfaces (isolation of driver compartment, draping, etc.).
- Confirm for both origin and destination facility the location for patient hand-off. This location will likely be pre-determined by facilities and chosen to minimize environmental exposure at the facility and prevent exposure of unprotected staff, patients, and visitors.
- Confirm for both origin and destination facility the location for donning and doffing of PPE for transporting ambulance personnel and assure ambulance decontamination and disinfection location established.
- Assure plan at destination hospital and ambulance decontamination location for managing regulated (Category A) hazardous waste.
- Assure appropriate supervision for the doffing of ambulance personnel PPE as hospital PPE and doffing protocols may be different.
- Determine the need for additional security with sending and receiving facility, as well as law enforcement personnel needs during transport and at the healthcare facilities.
- Ensure medical director (or appropriate person providing medical oversight) is immediately available for consultation throughout the transport.
- Communicate with sending facility for patient updates and to confirm patient transfer location.
- Contact sending facility to verify patient management steps have been taken to facilitate event-free transport and reduce risk of exposure.
- Establish guidelines to define the clinical care objectives for patients whose condition deteriorates en route to the receiving facility.
EVD/VHF Precautions

- Hold mission briefing for transport team to review:
  » Purpose and team primary contacts
  » Transport provider health check
  » Patient history and condition
  » Infection control posture – ambulance configuration and personnel PPE
  » Team member (paramedic, emergency medical technician (EMT), driver, supervisor/safety officer, EMS physician, etc.) roles and responsibilities, including supervision of donning and doffing procedures, etc.
  » Relevant clinical care guidelines including appropriateness of interventions or invasive procedures
  » Transportation of patient samples and medication, if applicable
  » Transfer of paper or electronic ambulance patient care records in a way that avoids contaminating the receiving facility
  » Decontamination and disinfection procedure
  » Waste collection and mission recovery
  » Post-mission surveillance
  » Interaction with security/law enforcement during the transport and at the receiving facility
  » Special considerations – transfer of patient across state borders, vehicle malfunction and other contingencies, etc.
  » Media policies
EVD/VHF Precautions

**During Transport**

- Depart for patient location and provide ETA at sending facility.
- Communicate with designated point of contact at each facility the arrival of transporting ambulance at sending and receiving facilities.
- Observe donning of PPE and, when ready, proceed to make patient contact (only the minimum number of providers necessary to manage the patient should be present).
- Conduct brief patient assessment to determine patient’s stability, “dry” or “wet” symptoms, and need for intervention before and/or during patient transport. Define appropriate interventions for patient deterioration. Minimize patient contact. For example, consider not obtaining vital signs if patient is “dry,” has no visual evidence of distress or shock, and transport time is not prolonged.
- Transport patient in impervious suit if ambulatory, or in impervious sheets if non-ambulatory and stretcher-bound, as tolerated.
- Consider any patient belongings, which are typically bagged, labeled, and transported with the patient in the patient compartment, to be contaminated.
- Any documents provided by sending facility should be free of contamination. When in doubt, consider them contaminated and package as appropriate for transport by ambulance personnel.
- Report patient’s condition and ETA to receiving facility to facilitate their readiness to receive patient from transport agency immediately upon arrival, thus avoiding PPE-induced fatigue/dehydration for patient, ambulance crew, and receiving staff.
EVD/VHF Precautions

**Arrival to receiving facility**
- Confirm arrival with receiving facility and specific route of travel within facility before patient leaves ambulance.
- Transport patient to designated location in receiving facility – via the most direct route to isolation unit – ambulatory vs. stretcher. If any concern for stretcher contamination, transfer patient to hospital cart upon exit from ambulance.
- Ensure route of travel is secured.
- Transfer patient care to receiving facility team as arranged (and exercised).
- Package waste from transport prior to doffing PPE. Transfer waste to hospital or appropriate agency as previously arranged and in accordance with applicable regulations.
- Ambulance personnel doff PPE under supervision of qualified personnel (transport agency PPE ensemble and hospital PPE may differ). If ambulance personnel are performing ambulance disinfection and have not exceeded service threshold for time in PPE, may proceed with disinfection prior to doffing.
- Return to ambulance driver’s compartment and proceed to designated decontamination/disinfection station.
- Disinfect ambulance per protocol.
- Conclude mission, debrief providers, and initiate surveillance as appropriate.

**Ambulance preparation**
- If a commercial patient containment system is used these guidelines may be modified accordingly. EMS personnel must be carefully trained on these systems—including appropriate cleaning, disposition, and impact on mission recovery—and understand the limitations on patient care they impose.
- Apply clear plastic sheets (at least 4mil) or similar impermeable barrier cloth to ceiling and duct tape in place. If the ceiling is a flat impermeable surface, the agency may elect not to apply plastic to the ceiling.
EVD/VHF Precautions

- Overlap all seams by at least 1 inch.
- Apply sheets to walls, cutting holes for air supply/vents and exhaust.
- Seal any conduit between the driver compartment and the passenger compartment with plastic sheeting.
- Protect floor and benches with clear plastic sheets (at least 6mil), cutting holes for stretcher locks. At this point all surfaces should be protected by plastic. A large bag or plastic sheeting may be used for the “jump” seat.
- Stretcher will be protected with impervious sheet.
- ABHR and a spill kit/absorbent disposable rags should be immediately available.
- Essential medical equipment will be stowed in patient compartment sealed inside a clear plastic bag for easy access.
- Pre-pack medical supplies into individual plastic bags (may elect to re-organize bags/kits to minimize extra contents and/or to make cleaning easier, e.g., plastic tray organizers instead of fabric bags, packed into sliding closure clear plastic bags).
- Additional medical equipment will be stowed in patient compartment behind disposable barriers, protecting it from unnecessary exposure, but available if needed by cutting plastic.
- Oxygen delivery kit should be stowed in patient compartment and sealed inside a clear plastic bag for easy access. Consider manual disposable suction unit.
- All climate controls should be set for fresh, not recirculating air!
- Ventilation system in driver compartment will be set on high and not recirculating; crack windows/vents open.
- Exhaust vent in patient compartment will be set on high.
EVD/VHF Precautions

AMBULANCE DECONTAMINATION\(^\text{10}\)

1. Identify Decontamination Area:
   - Select an appropriate site for ambulance decontamination that protects the vehicle and the team from the weather, preferably a well-ventilated, climate controlled, large enclosed garage/structure.
   - Establish a secure perimeter.
   - Include considerations for waste management, security plan, public perception, and media visibility when selecting decontamination site.
   - Define and mark the clean/dirty zone boundary around the ambulance that requires PPE to cross.

2. Before Decontamination and Disinfection:
   - Assure appropriate supplies available.
     » Yellow caution tape
     » Appropriate sizes of PPE for personnel performing decontamination
     » Leak proof biohazard bags
     » Garbage bags
     » Autoclave bags with rubber bands
     » EPA-registered hospital disinfectant wipes
     » Spray bottles
     » Bottled water
     » Disposable rags
     » Alcohol based hand sanitizer
     » Absorbent compound or absorbent towels

\(^{10}\) Adapted from Example: Standard Operating Procedure (SOP) for Decontamination of an Ambulance that has Transported a Person Under Investigation or Patient with Confirmed Ebola.
EVD/VHF Precautions

» Spill Kit (absorbent, brush, pan, small red bag)
« Bio-safety check-off sheet, briefing template, donning check-off sheet, doffing check-off sheet, contact list

• The vehicle operator and patient care provider may be responsible for decontamination and disinfection of the transport unit or a separate team may be used. Both approaches have advantages.

• All waste, including PPE, drapes, and wipes, should be considered Category A infectious substances, and should be packaged appropriately for disposal.

• Personnel must be in appropriate PPE during decontamination and disinfection. A third person should also be available as a trained observer and to assist as needed.

• PPE should be donned and doffed per above guidelines.

• PPE selection should consider worker protection for biological exposures as well as based on the disinfectant used.¹¹

3. Spill decontamination:

• Grossly contaminated and visibly soiled surfaces must be decontaminated prior to disinfection.

• Gross surface contamination, including barrier drapes, must be treated with an EPA-registered hospital disinfectant according to directions on the label before soaking up the fluid with absorbent materials.

• Used absorbent materials are placed in labeled leak-proof container.

• After removal of visible contaminant, surfaces require disinfection as below.

¹¹ PPE Selection Matrix for Occupational Exposure to Ebola Virus
4. Disinfection:

- Disinfect the outside of any bags containing unused medical equipment as well as the stretcher, PAPR motor housings, etc. with an EPA-registered hospital disinfectant according to directions on the label.

- If equipment was removed from a protective bag in transit, assess the equipment to determine if it can be properly decontaminated and disinfected, or disposed of. All non-dedicated, non-disposable medical equipment used for patient care should be cleaned and disinfected according to manufacturer’s instructions and department policies.

- If the interior of the ambulance was draped prior to transport, remove the draping by rolling the drapes down outside in, from the ceiling to the floor of the unit starting at the front of the compartment and moving to the rear.

- Roll flooring drapes from the front to rear of the compartment, rolling drapes outside in.

- To facilitate packaging and transport, drapes can be gently cut into segments. It is important that all drape materials are in sections that are small enough to facilitate the insertion of the biohazard bags into an autoclave or pre-determined Category A infectious substance packaging for disposal.

- Personnel should manually disinfect the interior of the patient care compartment with an EPA-registered hospital disinfectant according to directions on the label. This should include attention to proper contact time and particular detail for high-touch surfaces such as door handles and steps using care to limit mechanically generated aerosols (e.g., no scrub brushes) and using the surface wipe method to disinfect.
EVD/VHF Precautions

- Once the manual interior wipe down has been completed, collect and package all waste as Category A waste. Place waste in biohazard bags for disposal. All bags will be closed using a gooseneck technique and the outer surface disinfected with an EPA-registered hospital disinfectant according to directions on the label. All waste is double-bagged and exterior surfaces disinfected. Biohazard bags may be inserted into autoclave bags provided by the receiving facility.

- Manually wipe with disinfectant the ambulance’s exterior patient loading doors and handles, and any areas that may have been contaminated.

- The full exterior of the ambulance does not require a disinfectant wipe down.

- Once the outside of all surfaces (including waste bags) have been wiped with disinfectant, then supervised doffing of PPE can occur into a final biohazard bag, which is closed and disinfected.

5. After disinfection/decontamination:

- Dispose of all waste according to organization protocols as well as local and federal regulations for Category A infectious substances. Best practice may be to transfer waste to the hospital for disposition.

- Additional cleaning methods may also be used. While not required, this may provide additional assurance to personnel and public prior to returning the vehicle to service.

  » Ultraviolet germicidal irradiation, chlorine dioxide gas, or hydrogen peroxide vapor can be used for an additional disinfection step. However, these should not replace the manual disinfection, as their efficacy against organisms in body fluids has not been fully established and these methods may require specialized equipment and PPE.

- The ambulance can then be returned to service.
EVD/VHF Precautions

HAND HYGIENE\textsuperscript{12}

- During the delivery of healthcare, avoid unnecessary touching of surfaces in close proximity to the patient to prevent both contamination of clean hands from environmental surfaces and transmission of pathogens from contaminated hands to surfaces.

- When hands are visibly dirty, contaminated with proteinaceous material, or visibly soiled with blood or body fluids, wash hands with either a nonantimicrobial soap or an antimicrobial soap and water.

- If hands are not visibly soiled, or after removing visible material with soap and water, the preferred method of hand decontamination is with ABHR.

- Wash hands with non-antimicrobial soap or with antimicrobial soap and water if contact with spores (e.g., C. difficile or Bacillus anthracis) is likely to have occurred. The physical action of washing and rinsing hands under such circumstances is recommended because alcohols, chlorhexidine, iodophors, and other antiseptic agents have poor activity against spores.

- Do not wear artificial fingernails or extenders if duties include direct contact with patients at high risk for infections with associated adverse outcomes.

PANDEMIC INFLUENZA

- PPE guidance for novel influenza and pandemic influenza may change rapidly. EMS agencies should monitor information from CDC and regulatory organizations at the state and federal level and have established contacts with infection prevention and control professionals.

- Novel influenza strains are usually initially managed according to Special Respiratory (Airborne + Contact + Standard) Precautions. If in doubt, the service should apply Special Respiratory Precautions until disease-specific guidance is available.

\textsuperscript{12}2007 Guideline for Isolation Precautions: Preventing Transmission of Infectious Agents in Healthcare Settings
Resources/Special Considerations

- Dispatch should update questions to reflect any screening needed for international, domestic, or local cases.

- Responding personnel should have a low threshold to mask the patient and wear appropriate PPE as influenza is transmissible prior to the onset of significant symptoms.

- Pandemics can place enormous strain on EMS services due to high call volumes and provider illness. Crisis standard of care plans may need to be implemented, including but not limited to:
  - Adjusted resource assignments based on availability (e.g., police only on reported vehicle crash until non-ambulatory injuries confirmed)
  - Auto-answer and caller deferral to information/prescribing lines for non-emergency situations
  - Recommending private transport when appropriate
  - Changing to “closest hospital” transportation or “batch” transports
  - Deferral of selected 911 requests for service
  - Expanding “left at scene” discretion/guidelines
  - Non-hospital destinations for appropriate patients
  - Changes in staffing, crew configuration, and use of novel response structures (“jump cars”, community paramedic response, etc.)
  - Adoption of N95 respirator conservation or re-use strategies

- If EPA-registered hospital disinfectants become unavailable or are in short supply during a pandemic, consider dilute bleach solution as per CDC and WHO guidance listed below under Resources.

- Changes to 911 communications center protocols and EMS responses will require medical director and service director policy development and approval and may require local ordinance and state statutory relief. These policies and supporting governmental actions should be planned prior to an event that overwhelms EMS resources.
RESOURCES

+ Crisis Standards of Care: A Systems Framework for Catastrophic Disaster Response
+ Crisis Standards of Care: A Toolkit for Indicators and Triggers
+ EMS Pandemic Influenza Guidelines for Statewide Adoption
PEDIATRIC ISSUES

• Children may be very fearful of caregivers in high-level PPE. Assure the ability to communicate with the child and explain what is happening and why in an age-appropriate manner.

• Caregivers who follow infectious precautions may be kept with the child if they wear appropriate PPE and have been providing care for the child during the current illness and there is no substantial risk of body fluid exposure during transport.

• Pediatric intravenous access can be difficult and the need for access must be balanced against the potential risk for needlesticks in the setting of potential blood-borne pathogens.

• Appropriate sizes of surgical masks should be available for children.

• Consider nasal/oral routes for analgesia and anxiolysis if intravenous access is not obtained.

• Assure that comfort objects (blanket, stuffed animal, etc.) can accompany the patient during transport.

• Do not avoid indicated procedures and medications for children simply because of a perceived risk of distress.

• Children are able to compensate for hypovolemia much better than adults by increasing their heart rate. However, hypotension and cardiovascular collapse can occur with little warning. Elevated heart rates can also be seen with fever, anxiety, and pain, making a determination of origin difficult. Assess perfusion, history, and other signs before assuming tachycardia is not related to early shock/sepsis.

• When possible, specialized EVD/VHF transport units should include agencies that routinely provide pediatric critical care interfacility transport.

• EVD commonly induces miscarriage. Providers should be aware of this issue and potential exposures and complications.

• Portable pediatric isolation transport units are available, but should only be used by personnel trained in their operation and limitations. The use of these units may significantly increase the patient’s anxiety during transport.

RESOURCES

+ Q&A’s About the Transport of Pediatric Patients (<18 years of age) Under Investigation or with Confirmed Ebola
AEROMEDICAL TRANSPORT

Note: This section refers to domestic air medical transport providers only.

- Policies on rotor-wing and fixed-wing transport of potentially infectious patients should be in place in each agency including questions at the dispatch level and process to provide information to the crews. Careful consideration should be given to whether aeromedical transport is appropriate for the specific patient. This may include consultation with the service medical director.

- Assure dispatch provides sufficient information to anticipate potential infectious risks.

- Obtain patient information from origin hospital for mission planning including appropriate PPE, equipment, and medications.

- Contact destination hospital to assure appropriate reception planning including isolation room (if required) staff, cart, PPE, and traffic/patient movement plan.

- For flights involving interface with ground transport units, assure communications plan and confirm appropriately trained and equipped providers (define needs and role – driver only vs. assuming medical care) as well as special ambulance preparation if suspect EVD/VHF case. Maintain communications to verify arrival times.

- Provide information for ground unit or receiving hospital briefing as required.

- Assure records transfer occurs safely and that records are not contaminated (e.g., seal in zippered clear plastic bag which can be wiped with disinfectant prior to hand-off).

- See general patient care considerations for the specific infectious precautions above.

- Spill kit, alcohol-based hand disinfectant, suction, disposable rags, biohazard bags, and medical supplies should be organized similar to ground unit recommendations above for suspect EVD/VHF transports.

- For long duration flights, consider a chemical toilet for ambulatory patients.

- Aeromedical clinical personnel should carefully plan and use PPE similar to ground units.

- Aeromedical clinical personnel should carefully plan in-flight medical contingencies and have appropriate medications and equipment available to reduce contamination of non-required materials.
Resources/Special Considerations

- Intubation should be performed at the hospital of origin if there is any concern about existing or potential respiratory insufficiency. Rapid sequence techniques should be used (as opposed to sedation-only techniques) to mitigate possible generation of infectious aerosols.

- Intubated cases with suspected airborne, droplet, special respiratory, and EVD/VHF diseases should have a HEPA inline filter on the ventilator exhaust.

- Providers should anticipate altitude-dependent changes in pulmonary mechanics as well as oxygen delivery. If a patient is not able to maintain oxygenation prior to transport despite intubation, positioning, paralysis, and 100% oxygen delivery, medical control consultation should be obtained.

- Movement of known EVD patients must be reported to CDC/Federal Aviation Administration (FAA) due to Federal quarantine and isolation laws.

- Transports of suspect or confirmed EVD/VHF patients are typically performed by ground units, but air ambulance should be considered for long distances. To contain infected materials and minimize contamination of the aircraft, a portable isolation unit is recommended for air ambulance transport. Coordination with the public health authority may help to identify qualified air ambulances through HHS.

- Pilots in rotor-wing aircraft transporting non-intubated airborne or special respiratory precautions patients should wear an appropriately fitted N95 respirator.

- Aeromedical services should assure availability of medical control consultation during transport.

RESOURCES

+ Example: Standard Operating Procedure (SOP) for Air-to-Ground (Air-Ground) Patient Handoff

+ Guidance on Air Medical Transport (AMT) for Patients with Ebola Virus Disease (EVD)

OCCUPATIONAL HEALTH/EXPOSURES

• Initial and ongoing training in the types of available PPE and demonstrated proficiency in donning and doffing of PPE is critical to worker safety.

• EMS personnel – both dispatch and responders – should be provided awareness and education about evolving diseases and known outbreaks in the community (e.g., high prevalence of active TB in shelter population, known norovirus outbreak in local nursing home population) and appropriate PPE to protect workers from these risks as part of usual operational processes.

• Significant blood and body fluid exposures should be reported immediately to a supervisor and medical evaluation ensured.

  » Significant exposures for EMS include blood, bloody saliva or urine, amniotic fluid exposure to eyes, mucous membranes, non-intact skin or by needlestick or bites. Any contact with blood or body fluids of EVD/VHF patient may be significant and should prompt decontamination and appropriate reporting.

  » Appropriate HIV and hepatitis screening/Hepatitis B antibody serology should be available whenever indicated.

  » Anti-HIV prophylaxis should be available whenever indicated.

  » An infection prevention and control provider should be available for consultation by the agency as needed.

• Contaminated clothing should be washed or discarded in accordance with disease-specific guidelines, generally with hot water, usual detergent, and the addition of household bleach. Discarding contaminated clothing is preferred when dealing with special pathogens.

• Higher levels of PPE cause increased heat stress as well as increased motor limitations that may lead to injury. These factors should be considered when determining the duties and duration of work while wearing the PPE ensemble.

• Responders should be fit and free of acute illness.
• HCWs should be medically monitored after providing care to a confirmed special pathogen case, even in the absence of a recognized exposure, for subjective illness and fever for the duration of the incubation period to ensure that any developing illness is recognized and swiftly evaluated. TB, hepatitis, and other exposures may require interval employee testing.

• EMS agencies should consider policies ensuring twice daily contact with exposed personnel to discuss potential symptoms and document fever checks for special pathogens.

• Any HCW who develops signs of illness should not report to work or should immediately stop working and notify their supervisor.

» Prompt medical evaluation should be arranged and notification of local and state health departments.

• HCW should be assessed regarding possibility of post-exposure prophylaxis or treatment depending on the agent and exposure. Post-exposure prophylaxis is seldom indicated with the exception of direct contact with patients confirmed to have Neisseria meningitidis or after a needlestick or other high risk exposure to an HIV positive source patient. Prophylaxis may be considered in unprotected exposures to a novel influenza virus. In selected situations vaccination may be indicated after a viral exposure (e.g., smallpox, EVD).

• EMS agencies should consider standardizing pre-exposure immunization requirements for personnel in accordance with public health vaccination recommendations.

• Behavioral health effects on responders exposed to or caring for a patient with a rare and highly infectious disease are likely substantial. Provision of support, resources, and appropriate follow up is required to improve resiliency. Repeated exposures or a prolonged incident will increase risks of behavioral health consequences.

• Patients suspected of having a contagious disease, particularly one associated with high mortality or stigma, will have significant behavioral health consequences that must be addressed through reassurance, provision of support, timely and accurate information about their condition as well as normal responses to isolation and stress, and access to more specialized and culturally-specific behavioral health follow-up and resources.
In case of PPE breach for EVD/VHF precautions:

- Move immediately away from sources of contamination to an area where the breach can be evaluated and doffing of PPE is possible.
- Assess the nature of the breach.
- Assess the risk of exposure to skin and mucous membranes.
- Any exposed skin should be washed thoroughly with soap and water, after which an ABHR can also be used. Care should be taken not to abrade or damage the skin.
- Exposed mucous membranes should be flushed thoroughly with water.
- Bleach solutions are not recommended for cleansing of skin as they may damage the protective outer layer of the skin.
- Supervisory personnel, occupational health, and public health authorities must be informed immediately in the case of exposure to bodily fluids.
- HCW should be assessed for the possibility of post-exposure prophylaxis or vaccination.

Acknowledgments

This playbook is a project of ASPR TRACIE with initial draft materials developed by Alexander Isakov, MD, MPH, Emory University; additional contributions and editing by John Hick, MD, HHS ASPR and Hennepin County Medical Center; and review by the TRACIE team. TRACIE gratefully acknowledges the contribution of materials from CDC, HHS/ASPR, the Emory-Grady EMS Biosafety Transport Program (Wade Miles, Aaron Jamison, Gail Stallings, John Arevalo, Jim Zerylnick, Sam Shartar), and the EMS Biosafety Transport Consortium (Emory University/Grady EMS, University of Nebraska Medical Center/Omaha Fire Department, US Department of State/Office of Operational Medicine, National Institutes of Health (NIH) Division of Fire and Rescue Services/NIH Division of Occupational Health and Safety, Fire Department of New York, Phoenix Air Group, American Medical Response).

Additionally, ASPR TRACIE thanks the following subject matter experts for their review of this document: Eric Alberts, Orlando Health, Inc.; Howard Backer, MD, MPH, California Emergency Medical Services Authority; Paul Brooks, Department of Homeland Security Office of Health Affairs; Thomas Breyer, International Association of Fire Fighters; Stephen Cantrill, MD, Denver Health and Hospital Authority; John Chiaramonte, Mission Critical Partners, Inc.; Carol Cunningham, MD, Ohio Department of Public Safety; Drew Dawson, National Highway Traffic Safety Administration Office of Emergency Medical Services (former); Daniel Dodgen, PhD, ASPR Office of Policy and Planning; Chad Dowell, MS, National Institute for Occupational Safety and Health; Patricia Frost, RN, MS, Contra Costa Health Services; Scott Giberson, BPharm, MPH, Centers for Medicare and Medicaid Services; Jack Herrmann, MSEd, ASPR Office of Policy and Planning; Ken Hopper, ASPR Office of Emergency Management; Kevin Horahan, JD, MPH, ASPR Office of Emergency Management; Rick Hunt, MD, ASPR National Healthcare Preparedness Programs; Rachel Kaul, LCSW, ASPR Office of Policy and Planning; Jon Krohmer, MD, National Highway Traffic Safety Administration; Pamela Lane, MA, National Association of Emergency Medical Technicians; Sherline Lee, MPH, Centers for Disease Control and Prevention; Syra Madad, DHSc, MSc, New York City Health + Hospitals; Rick Murray, EMT-P, American College of Emergency Physicians; Dave Pigott, MD, The University of Alabama at Birmingham Medicine; Frank Pratt, MD, MPH, Los Angeles County Department of Public Health; Angel Rivasrivera, MSN, BSN, ASPR Office of Emergency Management; Dennis Rowe, NREMT-P, National Association of Emergency Medical Technicians; Terry Schenk, MS, Florida Department of Health; Leslee Stein-Spencer, RN, MS, National Association of State EMS Officials; Amy Valderrama, PhD, RN, Centers for Disease Control and Prevention; Lynn White, MS, American Medical Response; and the National Association of EMS Physicians.
Brought to you by HHS ASPR, the Technical Resources, Assistance Center, and Information Exchange (TRACIE) was created to meet the information and technical assistance needs of regional ASPR staff, healthcare coalitions, healthcare entities, healthcare providers, emergency managers, public health practitioners, and others working in disaster medicine, healthcare system preparedness, and public health emergency preparedness. Find out more by visiting https://asprtracie.hhs.gov/ or accessing this fact sheet, or email us with any questions or requests for technical assistance.
